Features

➢ Type 4 PD Compliant with IEEE802.3bt
➢ 85 Watt Output Power
➢ 12V or 24V output with a wide adjustable output voltage range
➢ High efficiency DC/DC converter
➢ Overload, thermal and short-circuit protection
➢ 1500V isolation (input to output)
➢ Input voltage range 36V to 57V
➢ Low output ripple and noise
➢ Compact DIL package - 70mm(L) x 35mm(W) x 17mm(H)
➢ Complete PD solution with minimal (low cost) external components required
➢ Silvertel “design-in” assistance

Description

The Ag5800 is an IEEE802.3bt Power over Ethernet module that can deliver up to 85 Watts* of output power when connected to IEEE802.3bt compliant power sourcing equipment. Suitable for applications such as PTZ IP cameras, LED lighting, door access systems, intelligent displays and sensors, monitors and projectors.

The module’s input conforms to the IEEE 802.3bt standard for signature recognition and class programming. It has been designed to work with IEEE802.3bt and existing high power PSE’s from leading manufacturers.

The high efficiency DC/DC converter operates over a wide input voltage range and provides a regulated low ripple and low noise output. The DC/DC converter also has built-in overload, thermal and short-circuit output protection.

*See section 2.4.4 - Output Power

2 Functional Description

2.1 Overview

The Ag5800 has a single input that can be connected to two external bridge rectifiers (see Figure 1: Block Diagram). The Ag5800 was developed to be powered with the Silvertel Ag6800 IEEE802.3bt PSE or with IEEE802.3bt compliant PSEs from other leading manufactures. It can also be used with other high Power PSE's i.e. PoH PSE’s and Phihong’s legacy 12.5K signature PSEs with the setup explained in section 2.3.1 and 2.3.3.

Figure 3: Typical System Diagram

2.2 Power Supply

The Ag5800 is a Class 8 Type 4 IEEE802.3bt powered device, and as such should be powered with the appropriate power supply, this being either an IEEE802.3bt compliant PSE or a DC power supply with a minimum power specification of 52V at 3A. This minimum power supply rating must be chosen regardless of the customers load as the inrush and power limits of the Ag5800 are designed to provide >85W out. If the customer is designing their own PSE to use with the Ag5800 they must also ensure that the power supply to the PSE is capable of this minimum power capability.
2.3 Input

2.3.1 PD Signature

The Ag5800 input complies with the IEEE802.3bt specification and provides signature and control circuitry to give full backwards compatibility on PoE standards. When the inputs are connected to a Power Sourcing Equipment (PSE), they will automatically present a valid signature to the PSE. The equipment will then recognise that a valid PD is connected to that line and commence classification.

Note: The SA1 and SA2 pins must be connected together when used with a Phihong 12.5K signature resistance PSE i.e. POE80U/POE60U PSE. For all other PSE's these pins should be left unconnected.

2.3.2 Power Classification

The Ag5800 is a Type 4 - Class 8 PD requesting the highest nominal amount of power from an IEEE802.3bt PSE by displaying the correct class pulses as shown in Table 2 below. If the Ag5800 is connected to an IEEE802.3at PSE, the PSE will recognise the initial Class 4 pulse from the Ag5800 as a Type 2 PD and provide ~25W.

Table 2: Classification Table
2.3.3 Legacy Classification

If the Ag5800 is connected to a PoH PSE and the user requires the full amount of power then the user can connect Pin 6 (PoH_En) to Pin 7 (VIN-) providing the correct classification and achieving full power draw while connected to a PoH PSE - See Figure 4.

![Figure 4: PoH Enable Connection](image-url)
2.3.4 PSE Type Detection

The Ag5800 has three output pins which are used to indicate the PSE type that has been detected through the Physical Layer Classification. This is so that the powered device can either adjust its highest power state or renegotiate its power classification if required via the Data Link Layer, as detailed in the IEEE802.3bt specification.

Each output pin can be connected directly to an opto-coupler in order for the PSE type indication to cross the isolation barrier, as shown in Figure 5.

**Figure 5: Physical Layer Detect Configuration**

If an IEEE802.3af PSE is connected, the Ag5800 will power up but none of the detect outputs will be active.

If a standard IEEE802.3at PSE is connected, the AT-DET pin will be active and Opto1 will turn ON.

If a Type 3 IEEE802.3bt PSE is connected, the TYP3-DET pin will be active and Opto2 will turn ON.

If a Type 4 IEEE802.3bt PSE is connected, the TYP4-DET pin will be active and Opto3 will turn ON.

It is important to remember that Ag5800’s output is limited to the capability of the PSE.

Note: If the connected PSE does not support the Data Link Layer (DLL) Opto 1 to 3 do not need to be fitted and the Ag5800 will still draw the maximum power available from the PSE.
2.4 Output

2.4.1 DC/DC Converter

The Ag5800’s DC/DC converter provides a regulated low ripple and low noise output that has built-in output over-load and short-circuit protection.

2.4.2 Output Configuration

The Ag5800 has two outputs which must be connected either in parallel to provide 12V or in series to provide 24V, as shown in Figure 6: Output Configurations.

Output 2 voltage (VOUT2) tracks the output 1 voltage (VOUT1). The use of the two outputs separately is not recommended due to voltage regulation issues.

It is important that C1 and C2 are both used and connected as close to the output pins of the Ag5800 as possible (in both configurations).

![Figure 6: Output Configurations](image)

0V1 must always be the Ag5800 0V output
2.4.3 Output Adjustment

The Ag5800 has an ADJ pin, which allows the output voltage to be increased or decreased from its nominal value.

The adjustment range allows the Ag5800 to provide an output voltage from 10.5V up to 30.2V. Voltage must not be adjusted to less than 10.5V or permanent damage may be caused to the module.

Contact Silvertel for further details.

![Figure 7: Output Adjustment](image)

</table>

* RA1 must not be less than 91K. Adjusting Vout to less than 10.5V may cause permanent damage

Note: When used with a DC supply the output load current must be reduced to keep the maximum power output at 100W or below.

Table 3: Output Adjustment Resistor (R) Value
2.4.4 Output Power

The maximum available output power of the Ag5800 is limited by the available power supplied to the module, as a result, when powered by a DC supply the Ag5800 will be able to supply the rated 100W*. However, when used with an IEEE802.3bt PSE, which can only provide a maximum of 99W from its output, then the maximum achievable output power will be 85W.

* When the output voltage is adjusted to its maximum the power must be limited to 100W. e.g. with V_{out} set to 30V the output current must be reduced to 3.4A.

When calculating the output power, the following factors must be taken into account:

- Ag5800 efficiency
- PSE output power
- Cable and connector losses
- Input bridge rectifier losses

The graph shown in Figure 8 shows the maximum power output of the Ag5800 when connected to SilverTel’s Ag6800 IEEE802.3bt PSE and also the losses using different category cables.

Note: This was calculated using typical cable resistances and with schottky bridge rectifiers part number: SS36 (V_{f} of 0.5V at the operating current) - Ag6800 supply voltage of 55V.

Figure 8: Available Output Power with an IEEE802.3bt PSE Connection
2.5 Typical Connections

As shown in Figure 9: Typical Connection Diagram, a minimum of 1000µF must be connected across each output, positioned as close to the output pins as possible. These capacitors are needed for output filtering and step load change performance and can be a standard low cost electrolytic; they do not need to be a low ESR type.

The Signature and the Output Adjust inputs are optional and are provided to give greater flexibility to the Ag5800. Further information on using these inputs can be found in sections 2.3.2 - Power Classification and 2.4.3 - Output Adjustment.

Figure 9: Typical Connection Diagram
2.6 High Power Applications

Figures 10a and 10b show typical application diagrams for the Ag5800 connected to the Ag6800 PSE.

Figure 10: High Power configuration
3 Operating Temperature Range

It is important to remember that Ag5800 is a power supply, and as such careful consideration should be taken over the mechanical design of the host product, with provision for heat sinking and/or forced air cooling.

The Ag5800 will generate heat and has been designed to be soldered into the customers PCB which thermally connects the Ag5800 through the use of thermal pad or thermal paste such as thermally conductive oxime cure paste. The customer’s PCB can then be thermally mounted (using a Bergquist 0.1” ultra soft gap pad) to the chassis of the host equipment. Further thermal relief can be in the form of cooled or forced air, improving the power output.

Each application is different so it is impossible to give fixed and absolute thermal recommendations. However to obtain maximum power it is important that any enclosure used has sufficient heatsinking, ventilation and airflow over the Ag5800.

Figure 11 shows the maximum ambient temperature under continuous load conditions. The Ag5800 is capable of handling 85W up to 70°C with continuous airflow while thermally heatsinked to the customers PCB and enclosure. A suggested mounting method is shown in Figure 16.
If the Ag5800 is thermally connected to the PCB and the customers’ enclosure, then 85W can only be obtained up to 60°C as shown in Figure 12.

![Graph: Operating Temperature (Thermally connected to PCB and enclosure)](image)

**Figure 12: Operating Temperature (Thermally connected to PCB and enclosure)**

If the Ag5800 is thermally connected to the PCB only, then 85W can only be obtained up to 50°C as shown in Figure 13.

![Graph: Operating Temperature (Thermally connected to PCB)](image)

**Figure 13: Operating Temperature (Thermally connected to PCB)**
Suggested layout and dimensions of the thermal relief pads can be found in Figure 14 and Figure 15.

The Operating Temperature vs Power Output can be summarised as shown in Table 4 below:

<table>
<thead>
<tr>
<th>Temperature</th>
<th>Heatsink Type- Ag5800 to:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>PCB</td>
</tr>
<tr>

<td>85W</td>
</tr>
<tr>
<td>40°C</td>
<td>85W</td>
</tr>
<tr>
<td>50°C</td>
<td>85W</td>
</tr>
<tr>
<td>60°C</td>
<td>80W</td>
</tr>
<tr>
<td>70°C</td>
<td>70W</td>
</tr>
<tr>
<td>85°C</td>
<td>40W</td>
</tr>
</tbody>
</table>

Table 4: Operating Temperature vs Power Output

When intended for use in ambient temperatures below 0°C we would recommend a low ESR electrolytic capacitor be used on the DC output. Capacitors rated for -55°C operation should be used below 0°C.

3.1 PCB Thermal Layout

To attain continuous 85W operation the Ag5800 must be thermally connected to the customers PCB and their enclosure or heatsink. The thermal layout should have copper pads with a via array to help draw the heat through the PCB to the heatsink. An example of a thermal layout can be found below in Figure 14 with dimensions shown in Figure 15.
3.2 Heatpad Footprint

Suggested Heatpad Footprint

(Top View)

Dimensions (in mm) are nominal +/- 0.25 unless otherwise stated

Figure 15: Suggested Heatpad Footprint
3.3 Heat Sink Assembly

Figure 16: Suggested Heat Sink Assembly
4 Isolation

To meet the isolation requirements of IEEE802.3bt section 145.4.1 a Powered Device (PD) must pass the electrical strength test of IEC 60950 sub clause 6.2. This calls for either a) 1500VAC test or b) 2250V dc for 60s or c) 1500V impulse test. The Ag5800 has been designed to meet c) 1500V impulse test.

When mounting the module to the heat sink, you must ensure a clearance of 1.5mm minimum between the pins of the connectors and the heat sink or use some form of isolation such as at least two layers of 3M#56 insulating tape.

*Figure 17* shows the position of the isolation barrier on the bottom of the Ag5800.

![Figure 17: Position of the Isolation Barrier](image)

5 Protection

The Ag5800 must be protected from over-voltages exceeding the 80V maximum rated surge input voltage. An inexpensive but effective solution can be achieved by connecting a tranzorb diode across the input; see apps note “ANX-POE-Protection”.

© Silver Telecom 2022
6 EMC

The Ag5800 has been designed to pass EN55032 Class B, however the Ag5800 will only be one component within a system so we would always advise that provisions are put in place in case further noise reductions are needed. From our extensive experience we would recommend the inexpensive but effective solution to reduce emissions shown in Figure 18.

![Figure 18: EMC Filtering](image_url)

Note 1: Typical figures are at 25°C with a nominal 57V supply, parallel output configuration (unless otherwise stated) and are for design aid only. Not Guaranteed
Note 2: The output can operate up to 100W with a DC Supply but must not exceed 100W or 8.4A Parallel / 4.2A Series.
Note 3: The Ag5800 has been designed to work normally when no load is connected, however a small load maybe required in order to keep the PSE on during its MPS check.
